☎ +57 319 516 2888

Hands-on Senior AI Engineer & Founder with proven track record of architecting and deploying production-grade GenAI pipelines. Expert in Python, Node.js, and LLM orchestration. Built to deliver secure, observable, and highly optimized multi-agent systems (CI/CD, observability, scalable cloud infrastructure) that solve complex business problems at scale.

SKILLS

AI & ML Engineering:

LLM Integration
RAG Pipelines MCP
Agentic Architectures
(LangChain, LangGraph)

Backend & Data:

Python Node.js & TypeScript
Vector Databases
PostgreSQL Caching
System Design

Cloud & DevOps:

AWS Ecosystem (ECS, S3,
Lambda, RDS, Bedrock)
Docker Testing
CI/CD pipelines
Zero-downtime deployments

CERTIFICATION

**AWS Certified Solutions
Architect**
2026

Agentic AI Architecture
2025

EDUCATION

**Computer Science Minor,
Tecnológico de Monterrey**

Aug 2019 — Jul 2020

**Economics, BA,
Universidad de los Andes**

Aug 2017 — Jul 2021

LANGUAGES

English C1 (IELTS 2026)

Spanish Native

WORK EXPERIENCE

Founding AI Engineer

Closer AI

2025 – Present

Architected and scaled an AI-powered platform from concept to production, handling 10k+ daily conversations and driving the company to \$25k MRR.

- Designed and deployed autonomous AI agents using Python and LangGraph, successfully handling 70% of customer inquiries without human intervention.
- Engineered a scalable, multi-tenant backend architecture using Node.js and AWS, supporting 5X business growth while maintaining zero-downtime deployments.
- Implemented production-grade RAG pipelines utilizing vector databases and advanced prompt engineering to ensure grounded, hallucination-free LLM outputs.
- Built and maintained comprehensive CI/CD workflows, evaluation frameworks, and system observability to monitor AI agent cost, latency, and quality.

Senior Software Engineer

Globant

2024 – 2025

Led full-stack development initiatives for enterprise products serving 20k+ daily active users.

- Optimized backend APIs and data fetching strategies, reducing payload sizes and improving overall system response times by 35%.
- Architected modular component libraries and underlying business logic shared across 5 distinct engineering teams, reducing development time by 30%.
- Mentored 3 junior developers, guiding them on system architecture and efficient software delivery.
- Championed testing best practices by increasing automated test coverage from 45% to 80% using Jest and Vitest.

Mid-Level Software Engineer

Nice Actimize

2022 – 2024

Built and optimized high-throughput compliance systems processing 1M+ financial transactions daily.

- Engineered advanced caching layers and profiled data pipelines to reduce system load times by 40%.
- Redesigned complex incident management workflows and data models, cutting issue resolution time in half.
- Migrated legacy codebases to modern frameworks, significantly improving long-term maintainability and deployment speed.

Software Engineer

Avianca

2021 – 2022

Developed data-intensive analytics and operational tools deployed airline-wide.

- Standardized and refactored core data pipelines, improving critical reporting accuracy by 30%.
- Built robust internal tooling adopted by 400+ internal users across operations and logistics.
- Introduced and formalized unit testing and automated QA practices to improve release stability.
